

I. Project Title

Exercise Routine Suggestions for Unfit People.

Proposed By:

COMPUTER SCIENCE 2

Coding in a Connected World: Development of Computational Thinking Skills

QUARTER 1

II. Problem Statement

One of the most common real-life problems is obesity. According to the World Health Organization, 43 percent of adults worldwide are overweight and 16 percent are living with obesity. This shows just how much of a problem obesity is. So, this project is focused on creating a possible and efficient exercise routine for people that are unfit, overweight, obese, and old people. This problem needs to be solved as if this problem is solved or even addressed properly, the world will undergo a change wherein people will become more active, much confident with themselves, and overall it might even lead to people discovering new things which might help the human race.

III. Project Objectives

- To create a simple workout (10-30 minutes) routine for people that need physical activities.
- To include at least 6-7 physical activities such as: walking, running, stretching, jumping, bench press, etc.
- To track each member's progress via checklists or graphs and return a positive note if the progress is enough and a motivating note if it's not enough.

IV. Planned Features

- Provide specific exercise routines for varying age groups
- Give feedback for their progress
- Encourage people to be more physically active
- Provide an effective yet not too long exercise routine daily
- Make people become more confident about their body

V. Planned Inputs and Outputs

The user will input their age group (Example, A for ages 10-16). Then the system will proceed with that information and decide which fits them (Example, 3 minutes of stretching, 10 minutes of jogging, 2 minutes rest, 3 minutes jumping jacks, 2 minutes rest, and 5 minutes of lifting).

VI. Logic Plan

- The user will enter the letter corresponding to their age group.
- The program will take the letter and match it with a valid age group
- The program will output the detailed exercise routine

COMPUTER SCIENCE 2

Coding in a Connected World: Development of Computational Thinking Skills

QUARTER 1

- It will show their name, routine, duration of each routine, and rest time
- The user follows the routine suggested
- It allows the user to input their progress and the program will store it
- When the user becomes accustomed to the routines, the program will give more challenging ones.

PseudoCode:

Start

Show the user a simple and detailed exercise routine for their entered age group

Display the routine and instructions for their age group

User will follow the instructions and exercise

It will ask if they completed the routine after a set amount of time

If they enter yes:

Record the session as complete

Display their progress

If they enter no:

Output a text telling them to stop in order to keep them from getting overexerted

Then encourage them to try again later

END
